
Antitarnish-A-POST-DIP

Antitarnish-A-POST-DIP is a concentrate of a tenside composition which is used as a static post-dip rinse in the immersion and electrophoretic deposition process of Antitarnish-A-100.

The product helps to remove undissolved particles of Antitarnish-A-100 from treated / passivated surfaces and avoids by this the staining on these surfaces.

Antitarnish-A-POST-DIP is used in a 1%-dosage.

Referring to the product information of Antitarnish-A-100 this rinsing step is preferably done after the static rinse to ensure an easy recycling of the drag-out back to the Antitarnish-A-100 bath tank.

Antitarnish-A-POST-DIP is a composition of different non-ionic tensides.

For further information please read the product information of Antitarnish-A-100 or Antitarnish-A-100 PRO-KIT and the material safety data sheet of Antitarnish-A-POST-DIP.

The product is delivered in 1-liter-bottles (Item-No.: 6007001).
